#### **Problem Statement:**

Given an array of 1s and 0s this has all 1s first followed by all 0s. Aim is to find the number of 0s. Write a program using Divide and Conquer to Count the number of zeroes in the given array.

#### **Input Format**

First Line Contains Integer m – Size of array

Next m lines Contains m numbers – Elements of an array

### **Output Format**

First Line Contains Integer – Number of zeroes present in the given array. ALGORITHM:

Step 1: Start

Step 2: Read the value of n from the user and initialize an array arr of size n. Read n values into the array.

Step 3: Check if the first element of arr is 0. If true, print n and exit the program.

Step 4: Call the divide function with arr, 0, and n-1 to find the index of the first occurrence of 0.

Step 5: If the index is not 0, print the value of n - index, which represents the count of 0s in the array. Otherwise, print the index.

Step 6: End

```
#include <stdio.h> int divide(int
[],int,int); int divide(int a[],int
left,int right)
{
  int mid=0;
  mid=left+(right-left)/2; if
  (a[0]==0) return 0; else if
  (a[right-1]==1) return right; if
  ((a[mid]==0) \&\& (a[mid-1]==0))
  return divide(a,0,mid); else if
  (a[mid]==0) return mid; else
  return divide(a,mid+1,right);
}
int main()
  int n;
  scanf("%d",&n); int
```

```
arr[n]; for (int
  i=0;i<n;i++)
     scanf("%d",&arr[i]);
  }
 int zero=divide(arr,0,n); printf("%d",n-
 zero);
OUTPUT:
```

Hence the above program has been executed successfully.

## AIM:

Given an array nums of size n, return the majority element.

The majority element is the element that appears more than [In / 2] times. You may assume that the majority element always exists in the array.

### Example 1:

Input: nums = [3,2,3]

Output: 3

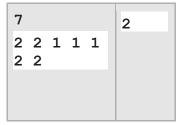

#### **Example 2:**

Input: nums = [2,2,1,1,1,2,2]

Output: 2

#### For example:

Input	
	RESU LT
3	3
3 2 3	

## ALGORITHM:

Step 1: Start

Step 2: Read the value of n from the user and initialize an array arr of size n. Read n values into the array.

Step 3: Use goort to sort the array arr in ascending order.

Step 4: Loop through the array to find the first and last indices of each element using the first and last functions. Calculate the count of occurrences (major).

Step 5: If any element's count is greater than or equal to n/2, return that element.

Step 6: Print the element that appears more than n/2 times or print 0 if none is found.

Step 7: End

```
#include <stdio.h> int mid=0,c=0; int
Count(int [],int,int,int); int Count(int
a[],int left,int right,int key)
{
```

```
int mid=left+(right-left)/2;
  if (a[mid]!=key)
     Count(a,left,mid,key);
     Count(a,mid+1,right,key);
  else
     c++;
  return c;
int main()
  int n; scanf("%d",&n);
  int arr[n]; for (int
  i=0;i< n;i++)
  scanf("%d",&arr[i]); int
```

```
k=arr[0]; if
  (Count(arr,0,n,k)>n/2)
  printf("%d",k); else
  {
    for (int i=0;i<n/2;i++)
      if (arr[i]!=k)
      {
        printf("%d",k);
        break;
    }
}</pre>
```

## OUTPUT:

Hence the above program has been executed successfully.

## AIM:

#### **Problem Statement:**

Given a sorted array and a value x, the floor of x is the largest element in array smaller than or equal to x. Write divide and conquer algorithm to find floor of x.

#### **Input Format**

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Value for x

#### **Output Format**

## First Line Contains Integer – Floor value for x

#### ALGORITHM:

Step 1: Start

Step 2: Read the value of n from the user and initialize an array arr of size n. Read n values into the array.

Step 3: Read the integer x from the user, which will be used to find the floor value.

Step 4: Call the search function with arr, x, 0, and n-1 to find the largest element in arr that is less than or equal to x.

Step 5: Print the floor value returned by the search function.

Step 6: End

```
#include<stdio.h> int
search(int[],int,int,int);
int search(int arr[],int x,int left,int right)
{
   int mid=left+(right-left)/2;
   if(arr[mid]<=x)
   {
     int max = arr[mid];
}</pre>
```

```
for(int i=0;i<mid;i++){
          if(arr[i] \ge max)
          max=arr[i];
       }
       return max;
    else if(arr[mid]>x)
     return search(arr,x,left,mid);
  else
     return search(arr,x,mid+1,right);
}
int main()
  int n,x,floor;
  scanf("%d",&n); int
  arr[n]; for(int
  i=0;i< n;i++){
     scanf("%d",&arr[i]);
  }
```

```
scanf("\%d",&x); floor =
  search(arr,x,0,n-1);
  printf("%d",floor); return
  0;
OUTPUT:
```

	Input	Expected	Got	
<b>~</b>	6 1 2 8 10 12 19 5	2	2	<b>*</b>
*	5 10 22 85 108 129 100	85	85	*
*	7 3 5 7 9 11 13 15	9	9	*

Hence the above program has been executed successfully.

AIM:

#### **Problem Statement:**

Given a sorted array of integers say arr[] and a number x. Write a recursive program using divide and conquer strategy to check if there exist two elements in the array whose sum = x. If there exist such two elements then return the numbers, otherwise print as "No".

**Note: Write a Divide and Conquer Solution** 

**Input Format** 

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Sum Value

**Output Format** 

First Line Contains Integer – Element1

Second Line Contains Integer – Element2 (Element 1 and Elements 2 together sums to value "x")

ALGORITHM:

Step 1: Start

- Step 2: Read the value of n from the user and initialize an array arr of size n. Read n values into the array.
- Step 3: Read the integer x from the user, which represents the target sum.
- Step 4: Call the twosum function with arr, 0, n-1, and x to find two numbers in the array that add up to x.
- Step 5: If a pair is found, print the two numbers; otherwise, print "No" to indicate that no such pair exists.

Step 6: End

```
#include<stdio.h> void twosum(int arr[],int
left,int right,int x){ if (left >= right){
  printf("No"); return;} int
  sum=arr[left]+arr[right]; if (sum==x){
  printf("%d\n",arr[left]);
  printf("%d\n",arr[right]);
}
```

```
else if(sum < x){}
     twosum(arr,left+1,right,x);
  }
  else{ twosum(arr,left,right-
     1,x);
int main(){ int n,x;
  scanf("%d",&n); int
  arr[n]; for (int
  i=0;i< n;i++){
  scanf("%d",&arr[i]);
  scanf("%d",&x);
  twosum(arr,0,n-1,x);
  return 0;
OUTPUT:
```

Hence the above program has been executed successfully..

## AIM:

Write a Program to Implement the Quick Sort Algorithm

**Input Format:** 

The first line contains the no of elements in the list-n The next n lines contain the elements.

#### **Output:**

Sorted list of elements

#### For example:

Input	RESULT
5	12 34 67
67 34 12	78 98
98 78	

## ALGORITHM:

Step 1: Start

Step 2: Read the value of n from the user and dynamically allocate an array arr of size n. Read n values into the array.

Step 3: Call the q\_sort function with arr, 0, and n-1 to sort the array using the Quick Sort algorithm.

Step 4: In the q\_sort function, select a pivot and partition the array into two halves. Recursively apply the same sorting process to both halves.

Step 5: Once sorted, iterate through the array and print the sorted values.

Step 6: End

## PROGRAM:

```
#include<stdio.h> void quicksort(int
arr[],int left,int right){ if(left<right){ int
j=right; int i=left; int pivot=left;
while(i<j){ while(arr[i]<=arr[pivot]){
i++;} while(arr[j]>arr[pivot]){ j--; } if(i<j){
    int temp=arr[i];
    arr[i]=arr[j];
    arr[j]=temp;
}</pre>
```

## **OUTPUT**:

	Input	Expected	Got	
~	5 67 34 12 98 78	12 34 67 78 98	12 34 67 78 98	~
~	10 1 56 78 90 32 56 11 10 90 114	1 10 11 32 56 56 78 90 90 114	1 10 11 32 56 56 78 90 90 114	~
~	12 9 8 7 6 5 4 3 2 1 10 11 90	1 2 3 4 5 6 7 8 9 10 11 90	1 2 3 4 5 6 7 8 9 10 11 90	~

## **RESULT:**

Hence the above program has been executed successfully..
